Through the looking-glass

(Lewis Carroll, 1871 – illustration by Sir John Tenniel)

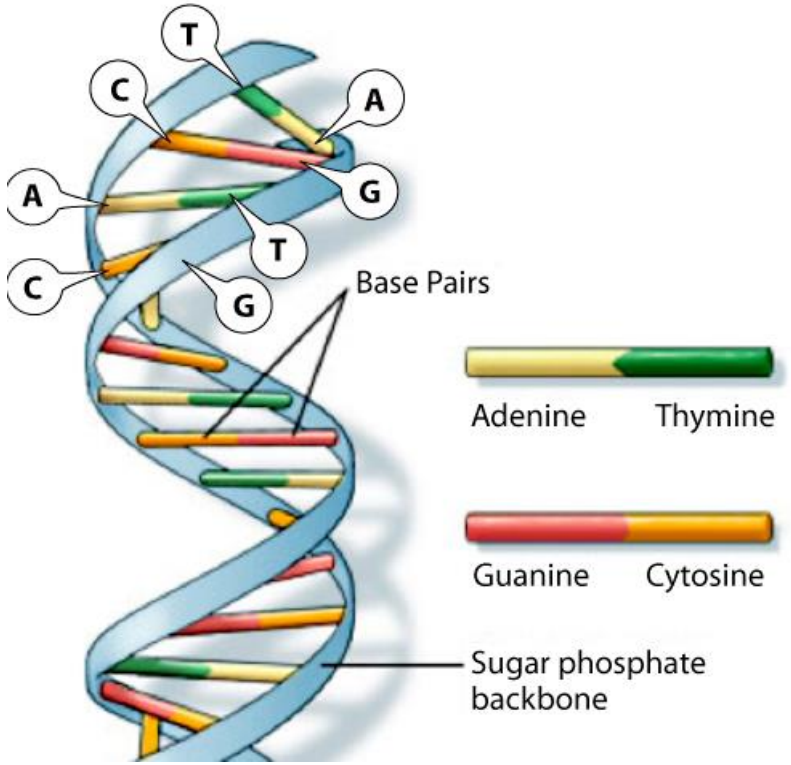
Outline

- Why unveiling interactions?
- How to identify interactions?
- What is the context?
- Are we ready for translational systemics?
- Take-home messages

Why unveiling interactions?

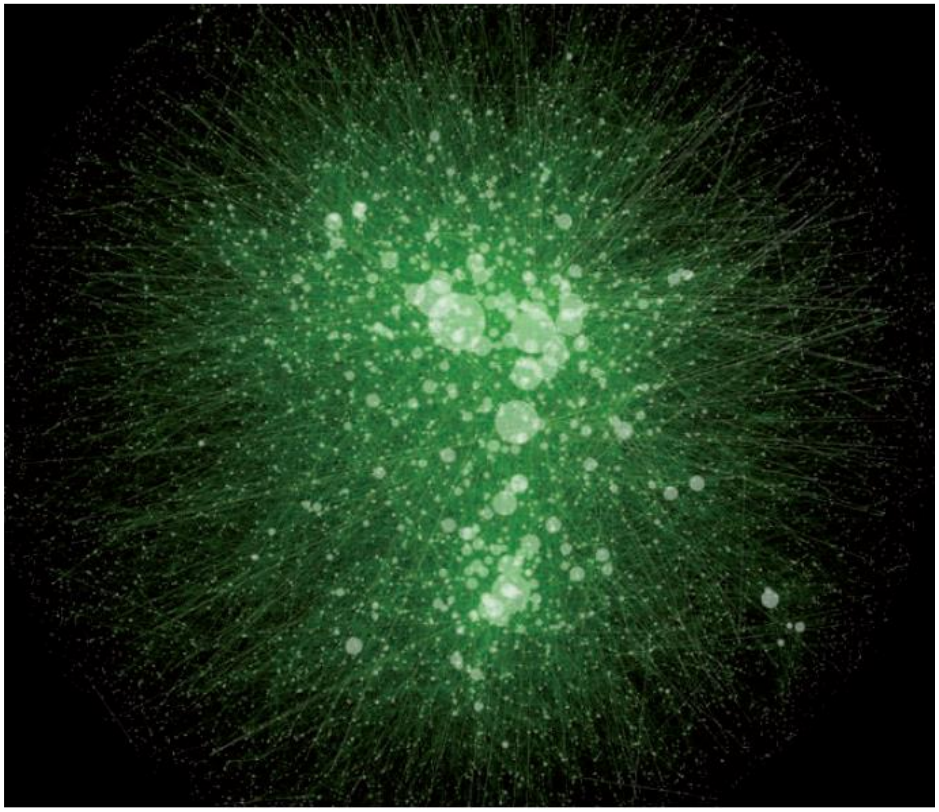
Differences between human genomes

- Any two people plucked at random off the street are on average 99.9 percent the same, DNA-wise (> 3 million differences).
- Most genome variations are relatively small and simple, involving only a few bases—an A substituted for a T here, a G left out there, a short sequence such as CT added somewhere else (somatic versus germline).



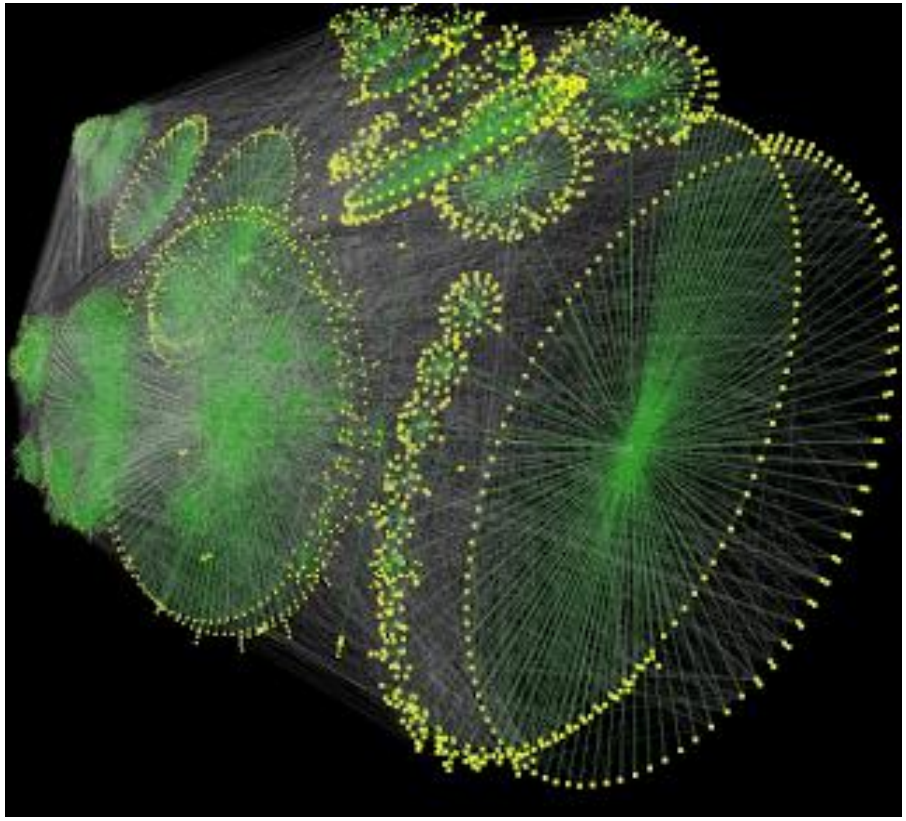
(U.S. National Library of Medicine)

Interactome differences between organisms



Human interactome

(Bonetta 2010)



Fruit fly interactome

(owww.molgen.mpg.de)

The “interactome”?

The **interactome** refers to the entire complement of interactions between DNA, RNA, proteins and metabolites within a cell. These interactions are influenced by genetic alterations and environmental stimuli. As a consequence, the interactome should be examined or considered in particular contexts.

Human interactomes

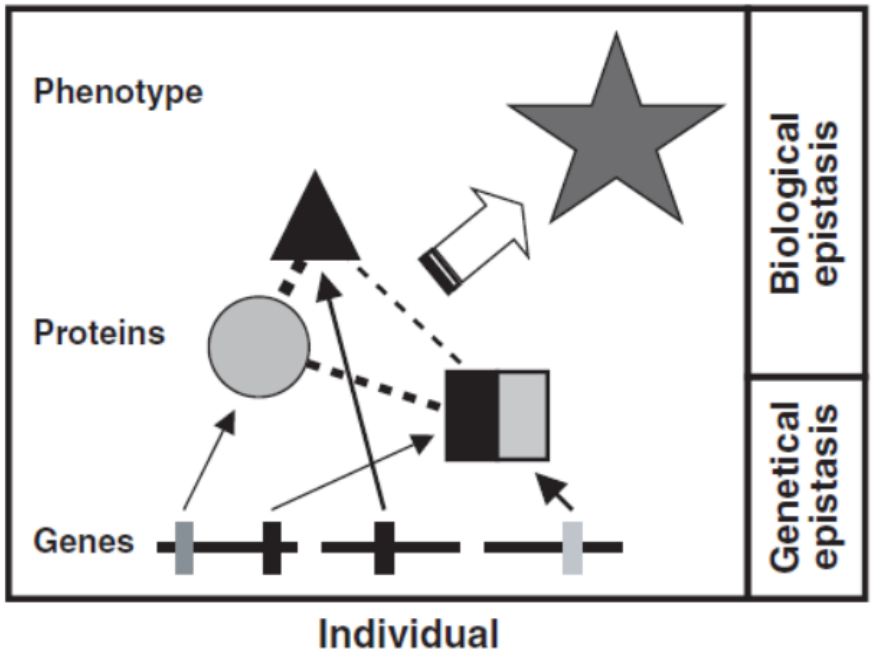
- Evolution seeks to keep our blood pressure, glucose levels and other important physiological and metabolic systems in a healthy range.
- For a phenotype to be buffered against the effects of mutations, it must have an underlying genetic architecture that is comprised of networks of genes that are redundant and robust.
- The existence of these networks creates dependencies among the genes in the network: “gene-gene interactions” or epistasis.
- This suggests that epistasis should not be a limited phenomenon and may have implications for personal genetics.

(Moore 2005, Moore and Williams 2009,
Mackay and Moore 2014)

How to detect interactions?

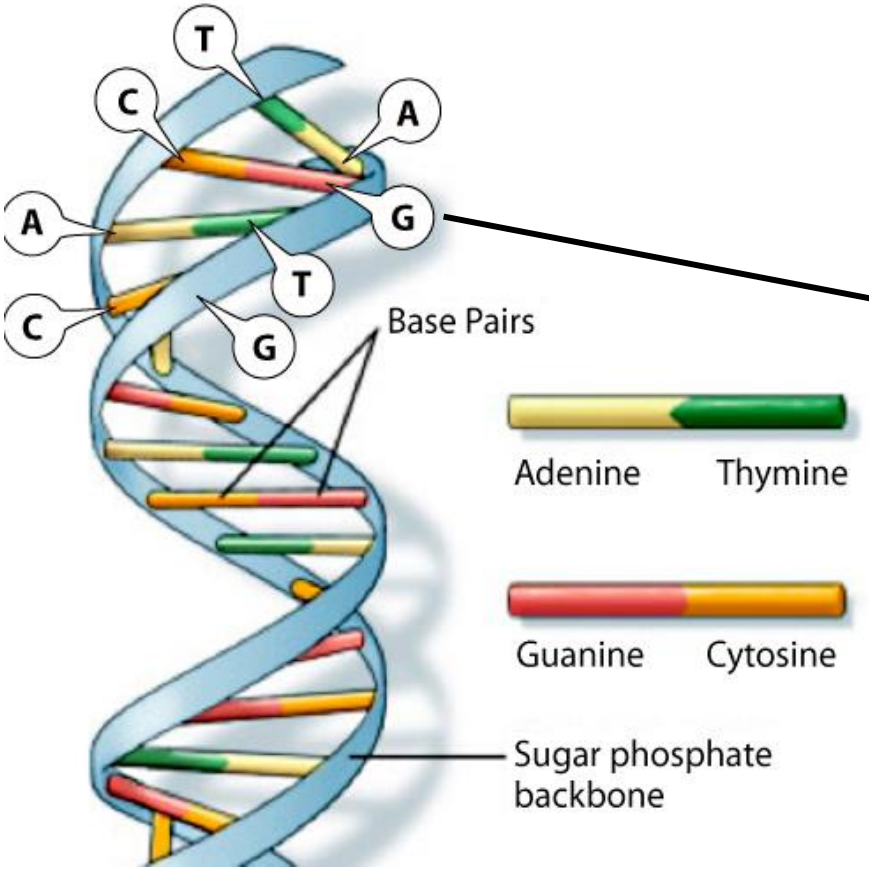
DNA-DNA interactions: biological viewpoint

- Two or more DNA variations may interact either directly to change transcription or translation levels, or indirectly by way of their protein product (to alter disease risk separate from their independent effects)



(Moore 2005)

Common genetic variations



Single Nucleotide Polymorphisms (SNPs)	Frequency in general population
G	95%
A	5% > 1%

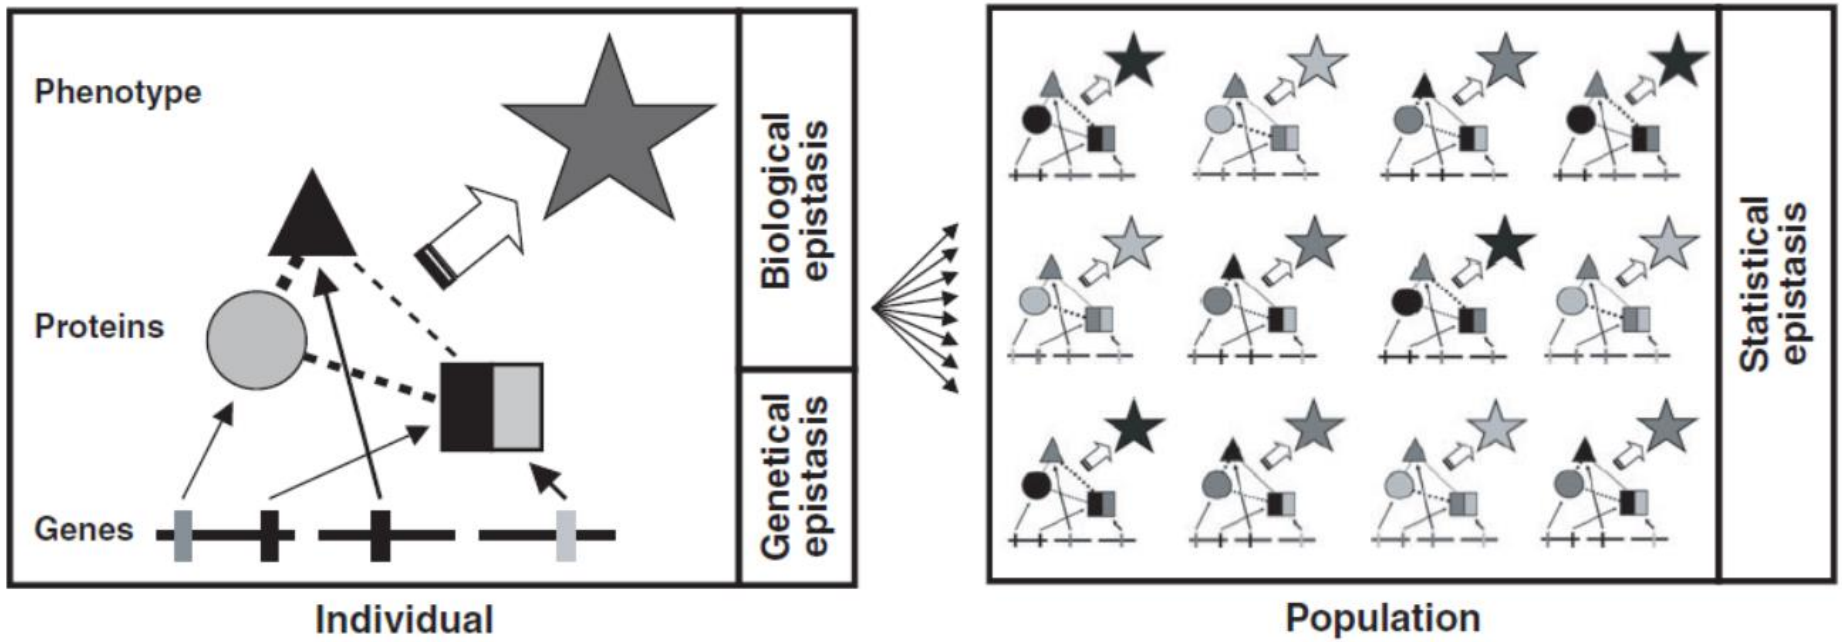
DNA-DNA interactions: multiple viewpoints

- **Biological epistasis** is the result of physical interactions among biomolecules within gene regulatory networks and biochemical pathways in an individual such that the effect of a gene on a phenotype is dependent on one or more other genes

- **Statistical epistasis** is defined as deviation from additivity in a mathematical model where the relationship between multilocus genotypes and phenotypic variation in a population is not predictable based solely on the actions of the genes considered singly.

(Moore and Williams 2005)

DNA-DNA interactions: aligning viewpoints



(Moore 2005)

Little correspondence

Replication

*"Leaving aside for the moment **what replication means** or should mean in the context of GWAIS, even for the currently so-called replicated genetic interactions it is unclear to what extent **a false positive has been replicated** due to the adopted methodological strategy itself or whether the replication of epistasis is not solely attributed to main effects (such as HLA effects) not properly accounted for."*

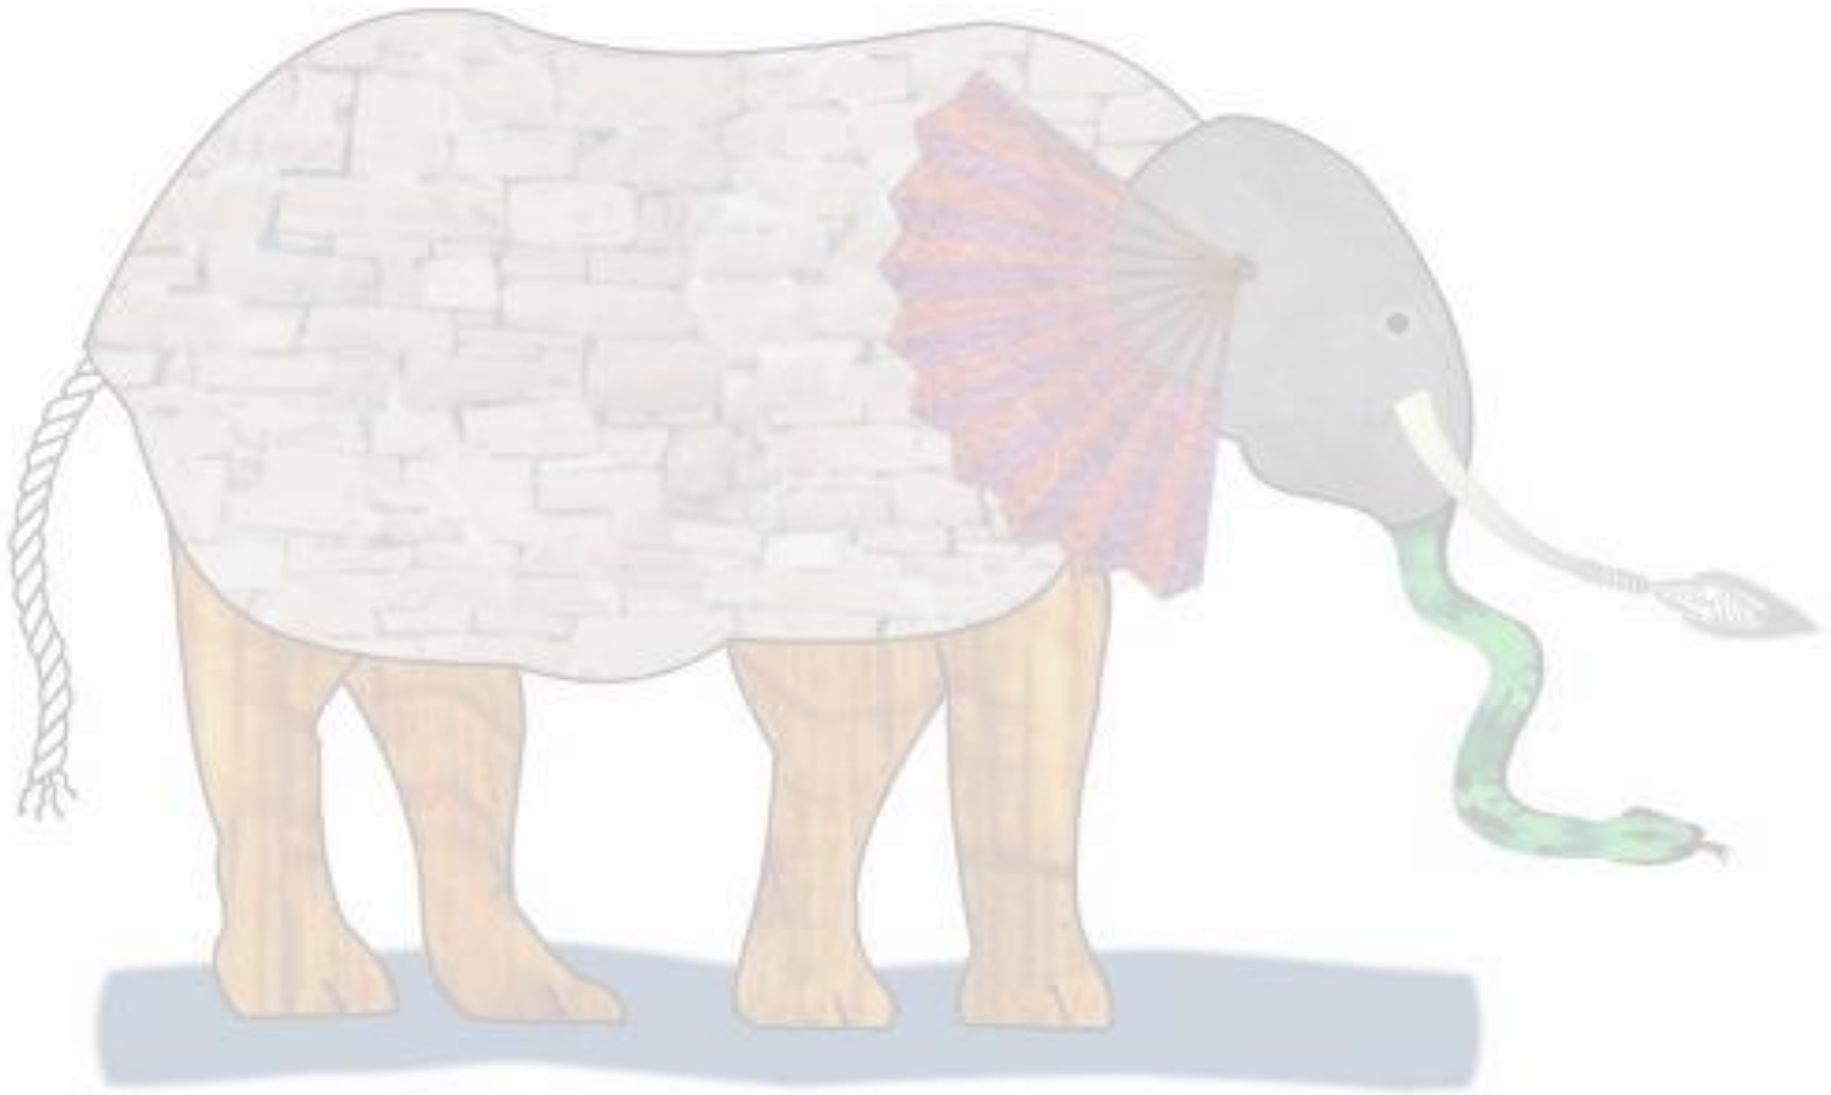
What is the “context”?



Context: systems medicine

- Human diseases are “complex systems”: network of interconnected components that may impact each other in non-linear ways

Holistic or systemic view

- When “systems” and their properties are not viewed as wholes but broken into parts, (dynamical) relationships will be broken as well.

Pragmatic approach

- A boundary needs to be chosen to determine the “whole” one wants to be holistic / systemic about.

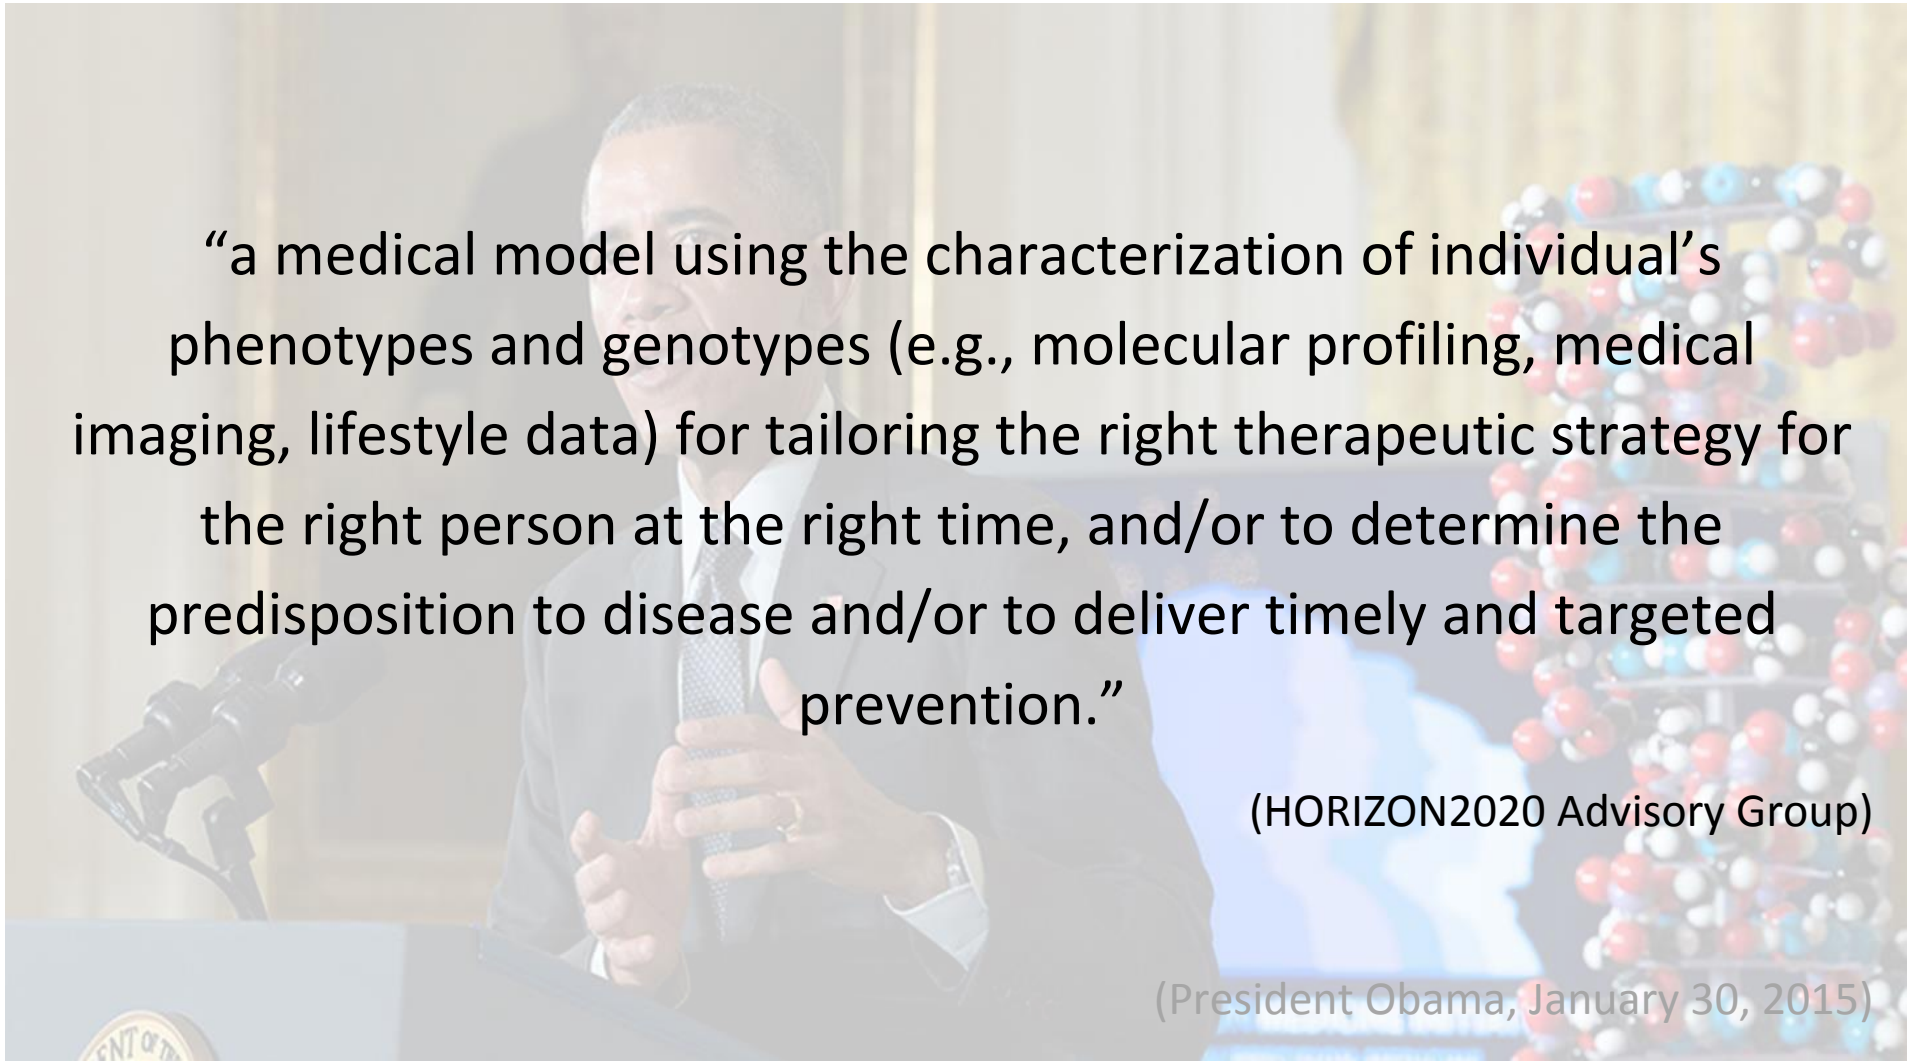
Personalized Medicine

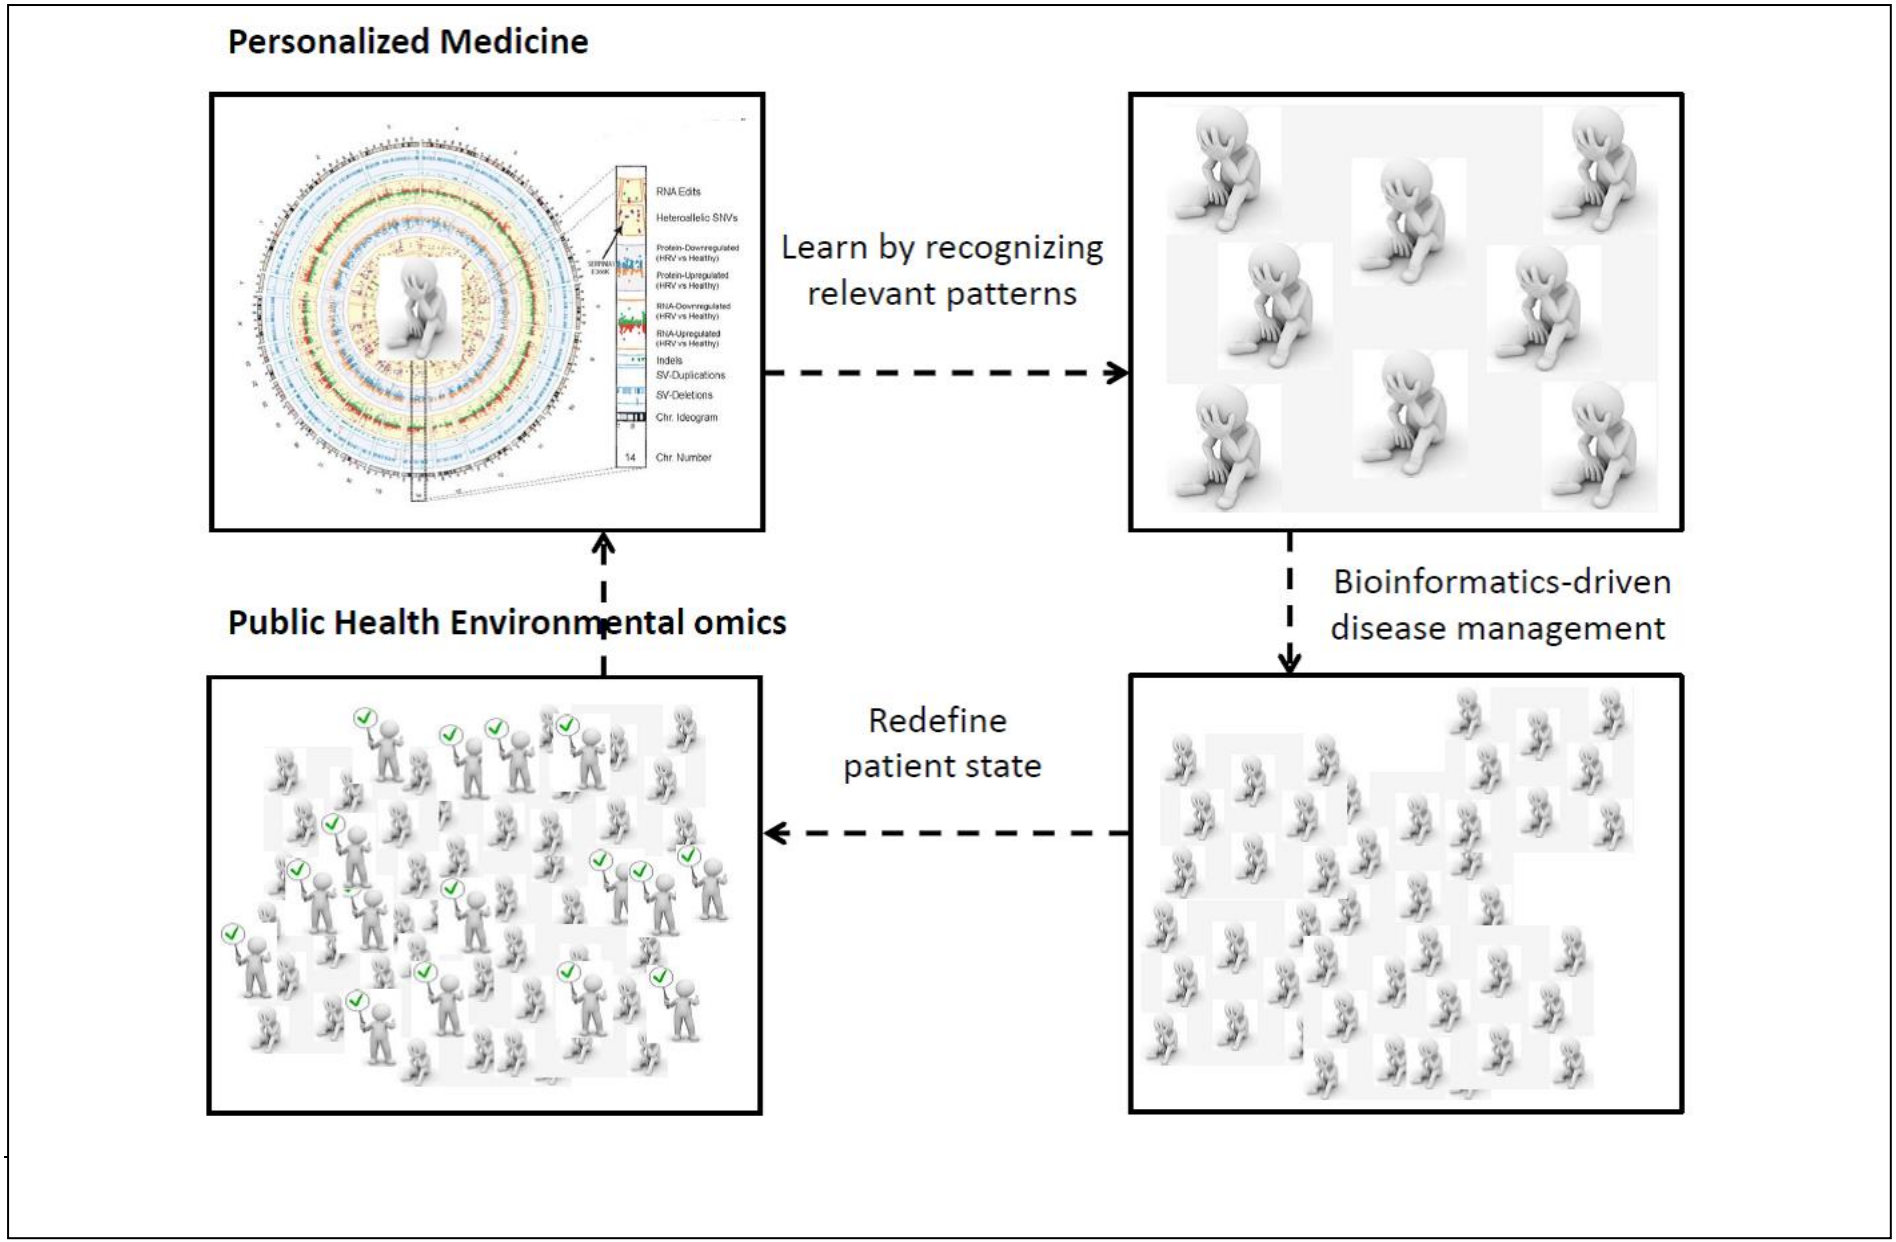


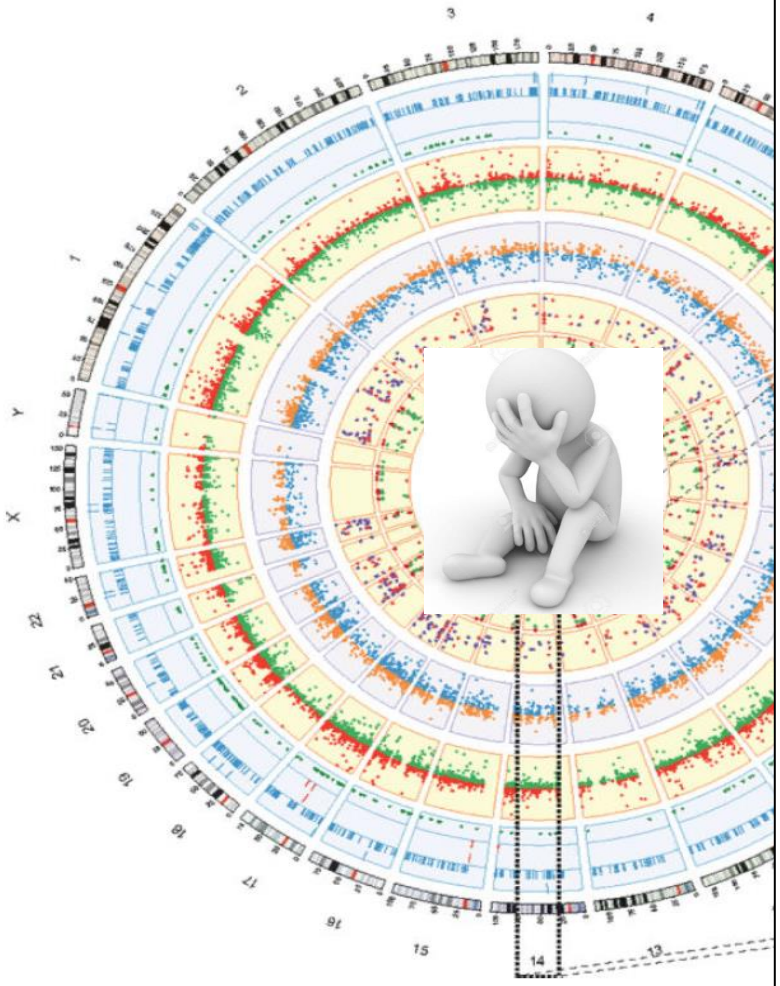
"a medical model using the characterization of individual's phenotypes and genotypes (e.g., molecular profiling, medical imaging, lifestyle data) for tailoring the right therapeutic strategy for the right person at the right time, and/or to determine the predisposition to disease and/or to deliver timely and targeted prevention."

(HORIZON2020 Advisory Group)

(President Obama, January 30, 2015)

Systemic thinking in precision medicine





Do you think that omics profiling will be routinely used in the clinic in future?

"Not in the form we are doing it – *iPOP (Integrated Personalized Omics Profiling)*.

… We just don't know, for the clinical tests, which thousand measurements are going to be most useful. We'll need certain measurements for diabetes, others for cancer, and specific tests will probably reveal themselves useful for different diseases."

(Snyder 2014)

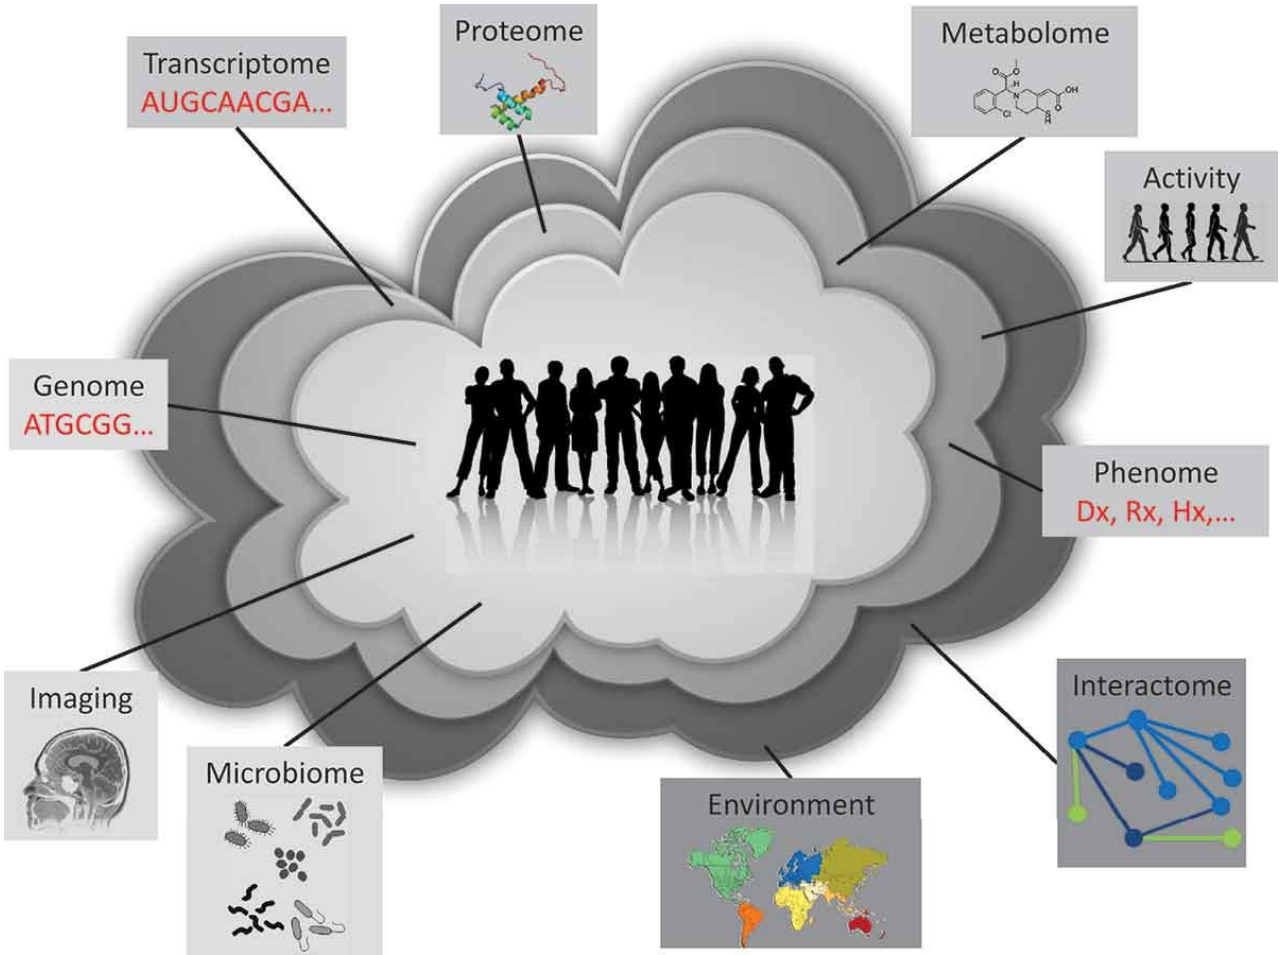
Precision Medicine: defining individual patterns of disease



(Huang et al. 2016)

Take home messages

- Context is important, although grasping this context is not always an obvious thing to do [patient/population substructures]
- Analytic developments involving interactions can benefit a lot from a transdisciplinary viewpoint rather than interdisciplinary viewpoints [hybrid machine learning and statistics]
- Open problems relate to: validation (causality), replication → individual risk prediction, heterogeneity handling (confounding), meta-analysis
- Small systems may be nice as toy examples but are by no means a reflection of the complexity in real life (at least not yet …):

Embrace Complexity

Through the looking-glass

Alice doesn't play by the conventional rules of a little girl during the 1800s; she's up for whatever comes her way and is willing to take a chance on the unexpected with brilliant results.
